

Tree 1: Flowering Cherry Tree. Reduce crown by approximately 7 metres across top and shape sides. Crown lifting to low or straggling branches interfering with small larch (B).

Tree 2: Weeping Silver Birch. Originally tree styled like umbrella but over last few years to top part of trunk now grown too high. Reduce Crown by 2 metres to flatten top and trim circumference of tree by 1 metre all round.

Tree 3: Copper Beech – reduce crown by 6 metres and shape tree. Crown lifting by 2 or 3 lower branches to left further from ground and allow light to garden and hedging below.

Tree A Magnolia – would like authorisation to remove this small tree to give more light under birch and copper beech. Not fully decided to remove but would like option.

Main reasons for tree reductions are to give more light to the garden which is having a negative impact on hedging, shrubs and small trees below.

Cherry Tree – some higher branches growing out towards cottages.

For information: Tree Surgeon will be Lee Bishop, Sunnyside Tree Surgeons
