

DESCRIPTION

Cesspools are designed for the underground storage of rainwater, sewage and grey water. **Cesspools** do not have an outlet so everything which is stored in them needs to be pumped out. There is an option of a high-level alarm, which can be set to warn you that the tank needs emptying.

If storing Silage, Elsan (chemical toilet waste) or Animal waste (from Kennels, etc.), it is important to use a cesspool with a liner as these wastes can damage the normal structure of the tank and cause it to leak; this also invalidates the warranty.

Shallow-dig cesspools are ideal for installations in a high water table area or difficult ground conditions such as rock. Depending upon ground conditions, this tank can be installed in granular or concrete backfill. If the water table (during any part of the year) rises above the proposed base of the tank it should be installed in concrete. Failure to do so will invalidate the manufacturer's warranty.
