

G1 Beech Screening Group: Works are for general maintenance and upkeep of grounds. Trees starting to overhang residents gardens. Would be reducing by a maximum of 3m, back to path edge with minor works on upper crown for balancing purposes only. The proposed works would not reduce the amenity value of the trees and will allow sustainable tree management in the long term.

T2 Hornbeam: Crown on NE side extends approximately 4.5m from main stem. Would be reducing by 1 to 1.5m (depending on growth point options). After reduce, there would be a residual branch length of 3m. The works are to reduce overhang to garden. The proposed works would not be detrimental nor reduce the amenity value of the tree.

T3 Oak: Crown on NE side extends approximately 8.5m from main stem. Would be reducing by 2 to 2.5m (depending on growth point options). After reduce there would be a residual crown width of 6 to 6.5m. The works are to reduce overhang to garden. The proposed works would not be detrimental nor reduce the amenity value of the tree.

This is an update to an existing M&R application which now is now to include the trees behind property 12 (highlighted with red) to the same specification of G1.
