

We inspected your tree to see if the tree was healthy and safe.

We noticed the following.

There is Bleeding Canker at the base and side of the tree.((Causes buttress and root rot.)

The tree is covered in various decay points. There appears to be a previous lightning strike to the main stem. It has various splits throughout the stem.

There are limbs that have heavy decay points in them.

It was advised, due to so many defects, plus the location of the tree. That it would be prudent to reduce the tree to a monolith (15-20ft) or totally remove it. If the tree was removed, we would need to put a new native heavy standard tree in to replace it.
