scale

Trees stand approximately 14m tall with an average crown width from centre of 5.5m on the Southern side.

Works are to reduce the Southern aspect only, by up to 1.5m to reduce overhang to property.

After the requested works, there would be a residual width of 4m on the Southern aspect with no discernible change to height or remaining sides.

Works are for general upkeep and maintenance of the site. Work would not be detrimental nor affect the amenity values of the trees or area.
